Trainer name: Fatma Guerfali

Learning Objectives

- Describe the essential steps to conduct a NGS experiment (from Biological question to Biological interpretation)
- Recognize the importance of experimental design and its influence on each of these step
- Summarize the essential elements of experimental design

H3ABioNet

Sequencing Depth

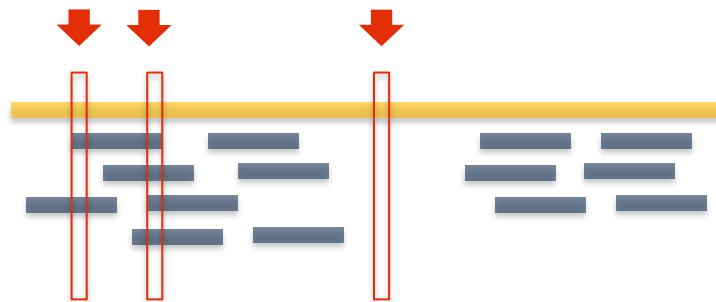

Coverage

High-pass sequencing design

Low-pass sequencing design

► Coverage

The (average) number of times each nucleotide is « read »
→ Fold Coverage (number + X)

► Detection of low frequency mutations within a mixed cell population

Somatic mutations may only exist within a small proportion of cells in a given tissue sample
→ region of DNA having the mutation must be sequenced at extremely **high coverage**, >1000×

► Genome-wide variant discovery

Study design involves sequencing many samples (hundreds to thousands) at **low coverage**
→ allows to achieve greater statistical power within a given population.

<https://informatics.fas.harvard.edu/whole-genome-resequencing-for-population-genomics-fastq-to-vcf.html#design/>

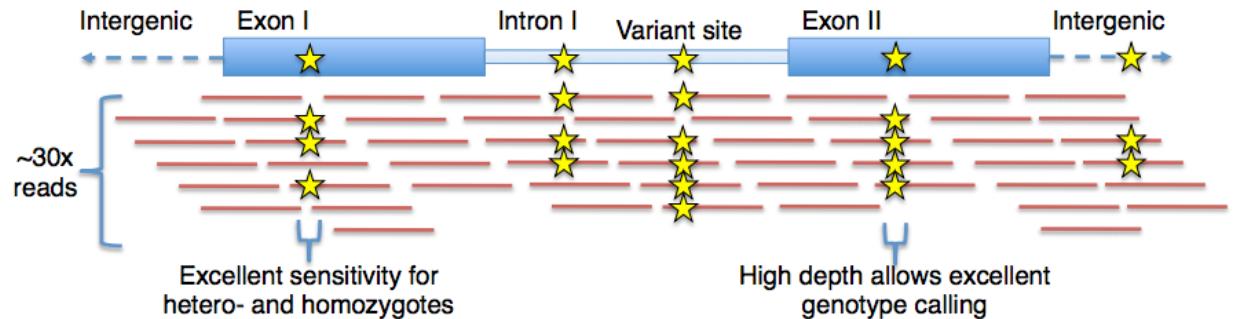

Sequencing Depth

Coverage

High-pass sequencing design

Low-pass sequencing design

Low-coverage WGS vs High-Coverage WGS
→ important to confidently call variants

Data requirements per sample

Targeted bases	~3 Gb
Coverage	Avg. 30x
# sequenced bases	100 Gb
# lanes of HiSeq	~8 lanes

Variant detection among multiple samples

Variants found per sample	~3-5M
Percent of variation in genome	>99%
Pr{singleton discovery}	>99%
Pr{common allele discovery}	>99%

Sequencing Depth

Coverage

High-pass sequencing design

Low-pass sequencing design

Data requirements per sample

Targeted bases	~3 Gb
Coverage	Avg. 4x
# sequenced bases	20 Gb
# lanes of HiSeq	~1.25

Variant detection among multiple samples

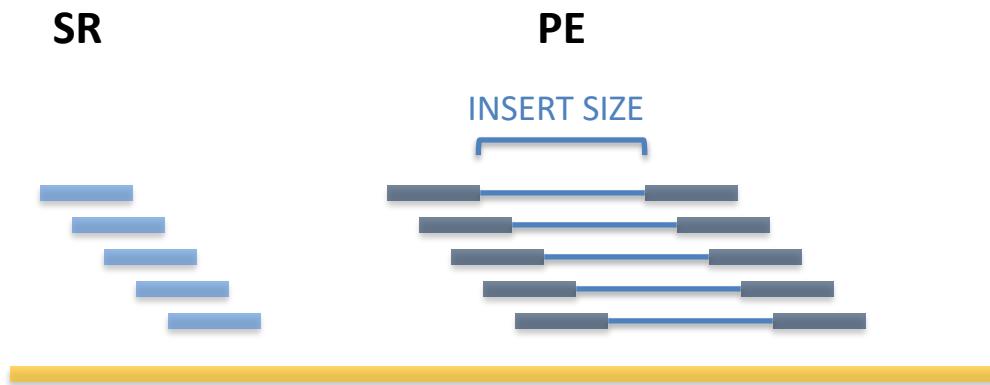

Variants found per sample	~3M
Percent of variation in genome	~90%
Pr{singleton discovery}	<50%
Pr{common allele discovery}	~99%

Chris Fields, 2019

Sequencing Mode

Single-End (SE/SR) vs Paired-end (PE)

- *SE (Single-End Reads)*
- *PE (Paired-end Reads)*: PE involves sequencing both ends of the DNA fragments and aligning the forward and reverse reads as read pairs

H3ABioNet

Pan African Bioinformatics Network for H3Africa

ADVANCED COURSES +
SCIENTIFIC CONFERENCES

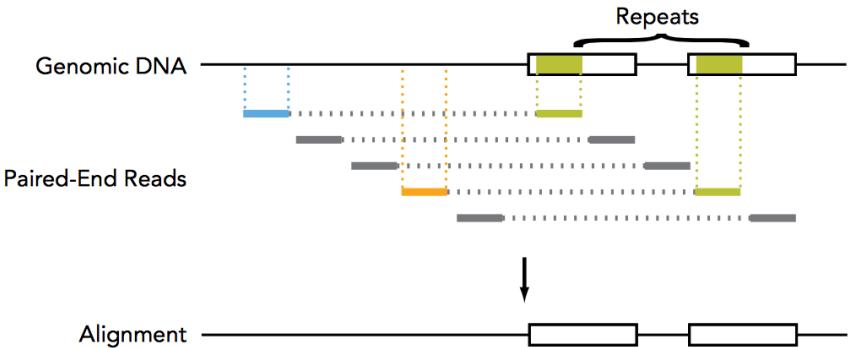

Next Generation Sequencing Bioinformatics
Trainer Name: Fatma Guerfali

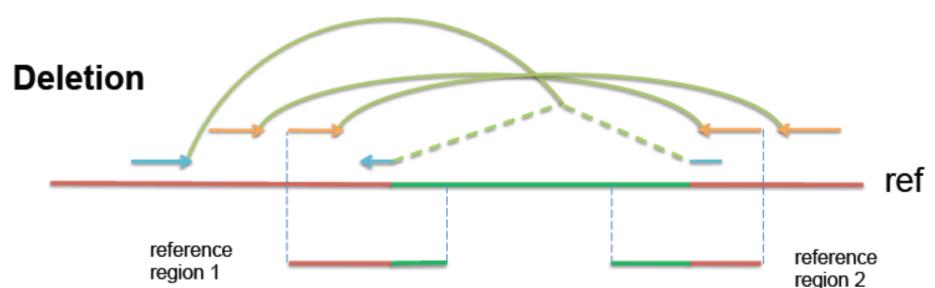

Sequencing Mode

PE Advantages

- *More accurate reads alignment*
- *Less ambiguous mapping of repeats*
- *Detection of even small deletions*
- *Estimation of InDels sizes*
- *Allows removal of PCR duplicates*
(common artifact resulting from PCR amplification during library preparation: via Analysis of differential read-pair spacing)

Reads in repeats (green) can be unambiguously aligned in complex genomes. Each read is associated with a paired read (blue or orange) and the separation between read pairs is known from the fragment size of the input DNA.

Sequencing Strategy: WGS vs WES

- **WGS:** Covers all, but higher cost if deep sequencing required (30X - 50X - 100X)
- **WES:** Covers exons only, but higher coverage of transcribed sequences (**targeted**)
- **Targeted:** gene panels, etc

Whole genome

Exome

Chris Fields, 2019

Sample Size

Number

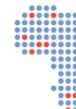

Single vs Multiple samples

Replicates

How many individuals to sequence?
Depends on the types of analysis to conduct !

- Describe population structure
→ few individuals
- Detailed demographic inference
→ small (old events, testing models)
→ Large (recent events)
- Identify allele frequency shifts or GWAS
→ Large (power to detect significant differences)

Next Generation Sequencing Bioinformatics
Trainer Name: Fatma Guerfali

Sample Size

Number

Single vs Multiple samples

Replicates

- Higher sensitivity for variants in the sample
- More accurate genotyping per sample
- Cost: no information about other samples

- Sensitivity dependent on frequency of variation
- Worse genotyping
- More total variants discovered

Chris Fields, 2019

Next Generation Sequencing Bioinformatics
Trainer Name: Fatma Guerfali

Sample Size

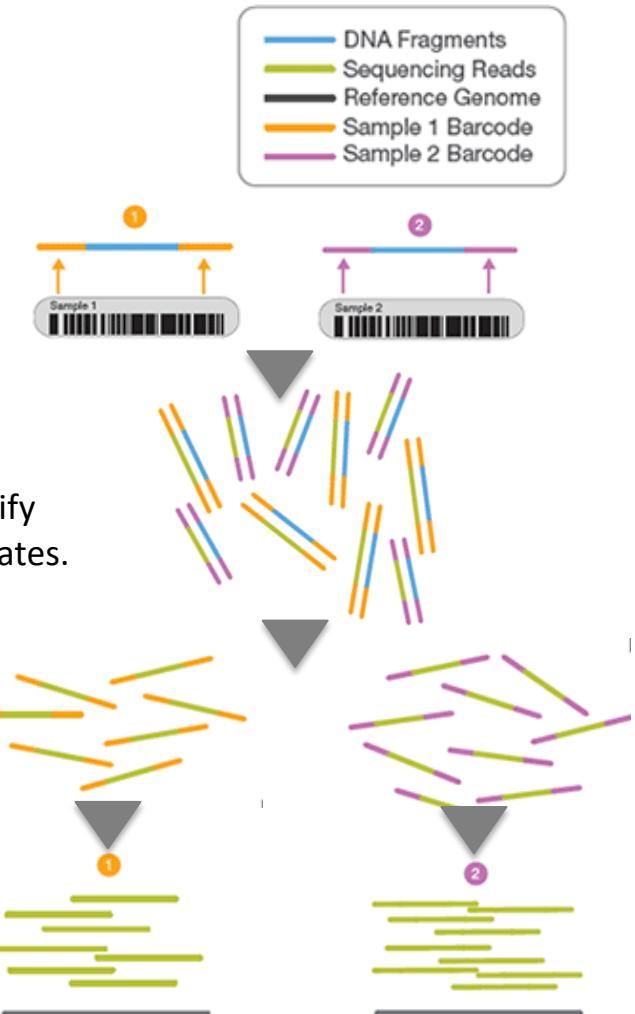

Number

Single vs Multiple samples

Replicates

► Multiplexing or not ?

- **multiplexing** = attach samples to a specific **barcode** sequence to identify later the sample from which it originates.
- Libraries pooled and sequenced in parallel
- Reads from each library are differentiated by using barcode to de-multiplex
- Each set is aligned to the reference genome

Sample Size

Number

Single vs Multiple samples

Replicates

► Multiplexing or not ?

Multiplexing (Pooled seq) vs individual barcoded sequencing

- **Multiplexing** : cost saving in library prep & have estimates of allele frequencies, but risk of unequal library representation & poor haplotype information
- **Individual** : variants can be called from individuals with high coverage, but higher cost

<https://informatics.fas.harvard.edu/whole-genome-resequencing-for-population-genomics-fastq-to-vcf.html#design/>

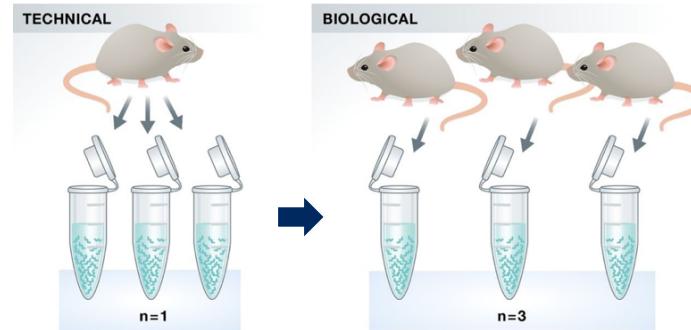

Sample Size

- Number and type of replicates

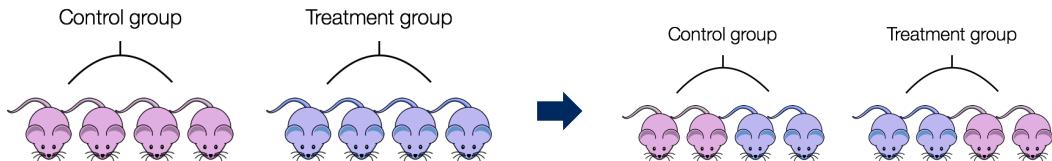

Number

Single vs Multiple samples

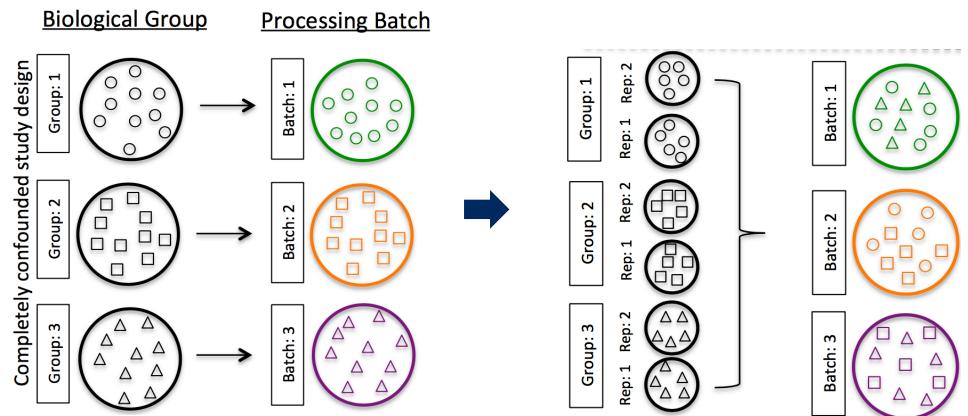

Replicates

- Avoid confounding effects

- Avoid batch effects

Take-home message

- Understanding each step of an NGS experiment is essential to properly design your NGS experiment (all connected, 1 step can bias the others)
- Because each step can be a potential source of bias → greatly affect the quality of the analysis and biological interpretation
- A proper Experimental Design takes into account all these special considerations and should be discussed with different actors of the analysis before performing the experiment (Biologists, Bioinformaticians, Biostatisticians)
